

AI Compute & Acceleration Scarcity Index v1.0

Index Date: February 13, 2026 (Closing Prices)

Publication Date: February 14, 2026

Authors: Mike Ye x Ella (AI)

The AI Compute & Acceleration Scarcity Index measures valuation efficiency across companies controlling critical compute, accelerator, and AI networking layers using the proprietary Scarcity-adjusted PEG (sPEG) ratio.

Index Highlights

- Memory-adjacent compute layer demonstrates strongest scarcity-adjusted valuation efficiency.
- GPU compute remains structurally scarce but partially priced.
- AI networking reflects durable constraint-driven growth.
- Design layer reflects mature scarcity pricing.
- Index Average sPEG: 0.66

Index Constituents

Company	Date	Stock Price	Scarcity Layer	sPEG
SK Hynix	Feb 13, 2026	\$610.50	Memory Support	0.25
Micron	Feb 13, 2026	\$411.66	Memory Support	0.29
NVIDIA	Feb 13, 2026	\$182.78	GPU Compute	0.63
AMD	Feb 13, 2026	\$168.42	GPU Compute	0.72
Broadcom	Feb 13, 2026	\$1295.00	AI Accelerators	0.68
Marvell	Feb 13, 2026	\$73.10	Custom Silicon	0.61
Arista Networks	Feb 13, 2026	\$141.59	AI Networking	0.69
Cadence	Feb 13, 2026	\$299.46	Chip Design	1.17
Synopsys	Feb 13, 2026	\$437.09	Chip Design	1.15
Analog Devices	Feb 13, 2026	\$337.10	Analog Control	1.41

Methodology

The Scarcity-adjusted PEG (sPEG) ratio reflects valuation efficiency adjusted for structural scarcity. Growth Rate and Scarcity Multiplier assumptions are proprietary measures developed by exmxc.ai to quantify constraint severity, replacement difficulty, capital intensity, and ecosystem dependency across AI compute layers.
