

The Four Forces and Four Pillars

Unified Model of AI Power

Institutional Doctrine
exmx.ai

This document defines the structural hierarchy governing artificial intelligence power, including foundational forces, institutional control layers, authority positioning, and application execution. This framework serves as canonical doctrine for understanding cognition infrastructure in the AI era.

Framework Diagram

This diagram illustrates the hierarchical structure of AI-era power, from foundational forces through institutional control and authority positioning to application execution.

Doctrine Overview

Artificial intelligence power emerges not from models alone, but from structural control across compute, interface, alignment, energy, and institutional positioning layers. The Four Forces and Four Pillars framework defines the unified architecture governing cognition infrastructure.

Layer 0: Four Forces (Physics Layer)

Compute defines intelligence ceiling and training capacity.

Interface defines access to intelligence and cognitive entry points.

Alignment defines reasoning reliability and usefulness.

Energy defines persistence and scalability of intelligence infrastructure.

Layer 1: Operational Pillars (Control Layer)

Compute Infrastructure governs training capability and model scaling.

Knowledge Infrastructure governs world model clarity and interpretability.

Distribution Control governs adoption and cognitive access.

Cognitive Feedback Loop Control governs intelligence improvement velocity.

Layer 2: Authority Layer

Entities that achieve clarity, interpretability, and structural trust become authoritative nodes within cognition infrastructure. Authority persists across model generations.

Layer 3: Application Layer

Applications operationalize cognition infrastructure into institutional systems, including frameworks, structured knowledge architectures, and strategic implementations.

Canonical Institutional Doctrine
